                       the small intestine.";
J. Leukoc. Biol. 56:807-811(1994).
-!- FUNCTION: Exerts a potent antimicrobial activity against both E. coli and B. megaterium.
-!- TISSUE SPECIFICITY: Small intestine and bone marrow.
-!- SIMILARITY: Belongs to the cathelicidin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               By similarity.

Tunor necrosis factor ligand superfamily member 6, soluble form (By similarity).

Cytoplasmic (Potential).

Signal-anchor for type II membrane

Extracellular (Potential).
-!- TISSUE SPECIFICITY: Expressed in activated splenocytes and thymocytes. Moderate or weak expression found in small intestines, kidney and lung.
-!- INDUCTION: By PMA/ionomycin and concavalin/interleukin-2.
-!- PMM: The soluble form derives from the membrane form by proteolytic perocessing (By similarity).
-!- SIMILARITY: Belongs to the tumor necrosis factor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Volvox carteri f. nagariensis.

DISEASE: Defects in TNFSF6 are a cause of autoimmune
DISEASE: Defects in TNFSF6 are a cause of autoimmune
DISEASE: Defects in TNFSF6 are a cause of autoimmune
DISEASE: Defects in TNFSF6 are a cail also known as
Canale-Smith syndrome (CSS). Aldes is a childhood syndrome
involving hemolytic anemia and thrombocytopenia with massive
Iymphadenopathy and splenomegaly.
SIMILARITY: Belongs to the tumor necrosis factor family.

Inhibition of leukocyte super:oxide anion prodn. and attraction of leukocytes - using peptide(s) partic. based on antimicrobial PR-39,

Claim 12; Page 28; 45pp; English.

AAW01447-W01454 represent fragments of the proline-arginine rich antimicrobial peptide PR39 (see AAW01446). The PR39 sequence was first isolated from porcine small intestine, and has also been identified in human and porcine neutrophils. PR39 kills bacteria by interfering with DNA and/or protein synthesis. PR39 also induces syndecan expression on mesenchymal cells. Syndecans are important in wound repair, showing that PR39 can be used in wound repair, as well as in antibacterial agents. These sequences, and PR39, can be used in the method of the invention. The method of the invention is for inhibiting leukocyte superoxide anion (O2-) production. The method comprises administering to a leukocyte a peptide (such as this sequence) capable of inhibiting leukocyte 02-

The peptides are also useful in connection with surgical procedures such as coronary bypass and organ transplantation surgery

definition into a mammal's bloodstream reduce reperfusion injury of preduction of reactive oxygen species, neutrophil adherence to condiction of reactive oxygen species, neutrophil adherence to requirements: they contain the consensus sequence PXXP, where P is a requirements: they contain the consensus sequence PXXP, where P is a problem of is any amino acid residue, which has been found to inhibit superoxide production, and secondly they have arginine residues adjacent to these motifs, required for effective inhibition. It was adjacent to these motifs, required for effective inhibition. It was established by structural and function analysis that a peptide should ideally contain 4 or 6 of these motifs, and that inhibition of the correlated with the increase of length of peptides. The effectiveness of these peptides was determined by investigating the production of the correlated with the increase of length of peptides. The effectiveness of these peptides was determined by investigating the production of the neutrophil chemotaxis. From this, it was found that all of the peptides inhibit and NADPH oxidase to some extent. All of the peptides also inhibit neutrophil oxidase to some extent. All of the peptides also inhibit neutrophil oxidase activity. PR-39 is believed, to be the most potent endogenous produced, it can be suggested to be involved in eliminating or reducing the reperfusion injury induced adhesion and extraction of neutrophils.
                                                                                                                                                                                                    ö
production. The peptides can be used as medicaments for fighting infection by attracting leukocytes to a wound site and restricting tissue damage at the wound site caused by excessive oxygen radicals produced by these leukocytes. They can also be used to develop products for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Proline; arginine; peptide; reperfusion injury; neutrophil; endothelium; superoxide; neutrophil superoxide anion; chemotaxis; NADPH oxidase; coronary bypass; organ transplantation surgery.

The method comprises the use of proline-arginine (PR)-rich antimicrobial peptides or their truncated analogues. The method is useful for attracting a leukocyte e.g. a mammalian leukocyte, porcine leukocyte, or a neutrophil, to a location, e.g. a wound site. The PR-rich peptides are useful as medicaments to fight infection by attracting leukocytes to a wound site, while restricting tissue damage at the wound site caused by excessive oxygen radicals produced by these leukocytes. The present sequence represents a PR-rich antimicrobial peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ç

The invention relates to inhibiting leucocyte superoxide anion (02-)
production using a naturally occurring proline-arginine (PR)-rich
antimicrobial peptide known as PR-39 and its truncated analogs. The
antimicrobial peptide known as PR-39 and its truncated analogs. The
cathod comprises contacting leucocytes with the peptide comprising 39 or
CC 66 amino acids, for a time and under conditions effective to inhibit
cof NADPH oxidase responsible for anion production, by binding to Src
chomology 3 (SH3) domain of p47phox, which is a 47 kDa cycosolic protein
cof the phagocytic NADPH oxidase complex. The leucocyte is a mammalian or
cof the phagocytic NADPH oxidase complex. The leucocyte is a mammalian or
cof the phagocytic sat least 6 cor 74 % of the total number of amino
acids, where the sum of the proline and arginine residues in the
cffective peptide is at least 6 for 74 % of the total number of amino
acids. This peptide inhibits leucocyte 02-production by the effective
binding to p47phox in whole cells, therefore interfering with the binding
cc of p47phox to p22phox. At least 14 or 25% of the amino acid residues in
c the peptide are arginine residues. The method of the invention is useful
cof inhibiting leucocyte oxygen radical production. The peptides are
cof a wound site, yet restrict tissue damage at the wound site caused by
cexcessive oxygen radicals produced by these leucocytes. The present
cc sequence is PR-39 analog, PR-16.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inhibiting leukocyte oxygen radical production comprises contacting a leukocyte with a peptide, where the inhibition occurs as a consequence of binding between the peptide and p47phox.

AAW01447-W01454 represent fragments of the proline-arginine rich antimicrobial peptide PR39 (see AAW01446). The PR39 sequence was first isolated from porcine small intestine, and has also been identified in human and porcine neutrophils. PR39 kills bacteria by interfering with DNA and/or protein synthesis. PR39 kills bacteria by interfering with DNA and/or protein synthesis. PR39 also induces syndecan expression on mesenchymal cells. Syndecans are important in wound repair, showing that PR39 can be used in wound repair, as well as in antibacterial agents. The method of the invention. The method comprises administering leukocyte superoxide anion (02-) production. The method comprises administering leukocyte a peptide (such as this sequence) capable of inhibiting leukocyte a peptide (such as this sequence) capable of inhibiting leukocyte or production. The peptides can be used as medicaments for fighting dissued amage at the wound site caused by excessive oxygen radicals produced by these leukocytes. They can also be used to develop products for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present invention relates to a method of inhibiting leukocyte superoxide anion (02-) production and/or attracting leukocytes. The method comprises the use of proline-arginine (PR)-rich antimicrobial peptides or their truncated analogues. The method is useful for attracting a leukocyte e.g. a mammalian leukocyte, porcine leukocyte, or a neutrophil, to a location, e.g. a wound site. The PR-rich peptides are useful as medicaments to fight infection by attracting leukocytes to a wound site, while restricting tissue damage at the wound site caused by excessive oxygen radicals produced by these leukocytes. The present sequence represents a PR-rich antimicrobial peptide.
                                                                                                                                                                                                                                                                                                                                                                                                              Attracting leukocyte to location by administering peptide including proline-arginine-rich antimicrobial peptide or its truncated analogs

The invention relates to inhibiting leucocyte superoxide anion (02-)

Continiorabial peptide known as PR-39 and its truncated analogs. The

Continiorabial peptide known as PR-39 and its truncated analogs. The

method comprises contacting leucocytes with the peptide comprising 39 or

26 amino acids, for a time and under conditions effective to inhibit

Co leucocyte superoxide anion production. The peptide inhibits the activity

of NADPH oxidase responsible for anion production, by binding to Src

homology 3 (SH3) domain of p47phox, which is a 47 kDa cytosolic protein

co f the phagocytic NADPH oxidase complex. The leucocyte is a mammalian or

porcine leucocyte and the mammalian leucocyte is neutrophil. Another

co porcine leucocyte and the mammalian leucocyte is neutrophil. Another

con acids, where the sum of the proline and arginine residues in the

effective peptide is at least 66 or 74 % of the total number of amino

acids. This peptide inhibits leucocyte 02- production by the effective

con peptide are arginine residues. The method of the invention is useful

con peptide are arginine residues. The method of the invention is useful

con peptide are arginine residues. The method of the invention is useful

con thibiting leucocyte oxygen radical production. The peptides are

consecul as medicaments for fighting infections by attracting leucocytes to

a wound site, yet restrict tissue damage at the wound site caused by

conseculate and paralogue by 23 analog by these leucocytes. The present
                                                                                                                                                                                                                                                                    Inhibiting leukocyte oxygen radical production comprises contacting a leukocyte with a peptide, where the inhibition occurs as a consequence of binding between the peptide and p47phox.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inhibitor; leukocyte O2- production; proline-arginine rich peptide; pig; antimicrobial peptide; small intestine; human; neutrophil; bacteria; bMA synthesis; protein synthesis; inhibitor; syndecan expression; mesenchymal cell; wound repair; supercoxide anion; infection; leukocyte; tissue damage; oxygen radical; inflammatory disease; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  엄
                                                                                                                                                                                                                                         AAW01447-W01454 represent fragments of the proline-arginine rich antimicrobial peptide PR39 (see AAW01446). The PR39 sequence was first isolated from porcine small intestine, and has also been identified in human and porcine neutrophils. PR39 kills bacteria by interfering with DNA and/or protein synthesis. PR39 kills bacteria by interfering with DNA and/or protein synthesis. PR39 kills bacteria by interfering with DNA and/or protein synthesis. PR39 also induces syndecan expression on mesenchymal cells. Syndecans are important in wound repair, showing that PR39 can be used in the method of the invention. These sequences, and PR39, can be used in the method of the invention. The method comprises administering leukocyte alektocyte a peptide (such as this sequence) capable of inhibiting leukocyte a peptide (such as this sequence) capable of inhibiting leukocyte or production. The peptides can be used as medicaments for fighting infection by attracting leukocytes to a wound site and restricting tissue damage at the wound site caused by excessive oxygen radicals produced by these leukocytes. They can also be used to develop products for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Proline; arginine; peptide; reperfusion injury; neutrophil; endothelium; superoxide; neutrophil superoxide anion; chemotaxis; NADPH oxidase; coronary bypass; organ transplantation surgery.

Sequences AAW75722-W75732 are proline/arginine rich peptides that upon administration into a mammal's bloodstream reduce reperfusion injury (production of reactive oxygen species, neutrophila adherence to endothelium, and extravasation of neutrophils). These peptides have two cendethelium, and extravasation of neutrophils). These peptides have two requirements: they contain the consensus sequence PXXR, where P is a compline residue and X is any amino acid residue, which has been found to inhibit superoxide production, and secondly they have arginine residues adjacent to these motifs, required for effective inhibition. It was contablished by structural and function analysis that a peptide should infally contain 4 or 6 of these motifs, and that inhibitory activity is correlated with the increase of length of peptides. The effectiveness of these peptides was determined by investigating the production of the neutrophil superoxide anion, and also the inhibition of neutrophil superoxide anion, and also the inhibition of neutrophil oxidase to some extent. All of the peptides also inhibit neutrophil contains activity. PR-39 is believed, to be the most potent endogenous down regulator of NADPH oxidase yet discovered, and from the data cordinated in injury induced adhesion and extraction of neutrophils. The peptides are also useful in connection with surgical procedures such as coronary bypass and organ transplantation surgery
                                                                   Reduction of reperfusion injury in temporarily occluded blood vessels by administration of a peptide which is rich in proline or arginine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Leukocyte superoxide anion; leukocyte O2- production; leukocyte attraction; proline-arginine-rich antimicrobial peptide; PR-rich antimicrobial peptide; neutrophil; wound site; infection; tissue damage; oxygen radical; antibacterial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

The invention relates to inhibiting leucocyte superoxide anion (02-)

production using a naturally occurring proline-arginine (PR)-rich
antimicrobial peptide known as PR-19 and its truncated analogs. The
method comprises contacting leucocytes with the peptide comprising 39 or
26 amino acids, for a time and under conditions effective to inhibit
CC leucocyte superoxide anion production. The peptide inhibite the activity
of NADPH oxidase responsible for anion production, by binding to Src
homology 3 (SH3) domain of p47phox, which is a 47 kba cytosolic protein
CC che phagocytic NADPH oxidase complex. The leucocyte is amammalian or
porcine leucocyte and the mammalian leucocyte is neutrophil. Another
CC method is also disclosed which employs a PR-19 analog that comprise 16
CC method is also disclosed which employs a PR-39 analog that comprise 16
CC acids. This peptide is at least 66 or 74 % of the total number of amino
acids, where the sum of the proline and arginine residues in the
CC binding to p47phox in whole cells, therefore interfering with the binding
CC p47phox to p22phox. At least 14 or 25% of the amino acid residues in
CC the peptide are arginine residues. The method of the invention is useful
CC inhibiting leucocyte oxygen radical production. The peptides are
CC a wound site, yet restrict tissue damage at the wound site caused by
CC excessive oxygen radicals produced by these leucocytes. The present

                                                                                                                                                                       The present invention relates to a method of inhibiting leukocyte superoxide anion (O2-) production and/or attracting leukocytes. The method comprises the use of proline-arginine (PR)-rich antimicrobial peptides or their truncated analogues. The method is useful for attracting a leukocyte e.g. a mammalian leukocyte, porcine leukocyte e.g. a wound site. The PR-rich peptides are useful as medicaments to fight infection by attracting leukocytes to a wound site, while restricting tissue damage at the wound site caused by excessive oxygen radicals produced by these leukocytes. The present sequence represents a PR-rich antimicrobial peptide.
                                        Attracting leukocyte to location by administering peptide including proline-arginine-rich antimicrobial peptide or its truncated analogs to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Leucocyte; superoxide anion; oxygen radical; proline-arginine; antimicrobial; antioxidant; NADPH oxidase; p47phox; neutrophil; infection; wound; tissue damage; PR-39 analog; PR-26.

AAR99116-R99123 are antimicrobial, magainin-analogue peptides that may be used to treat sexually transmitted diseases (STDS) caused by Chlamydia, HIV, herpes simplex virus, Neisseria gomorhoeae or Candida infection. The peptides inhibit STDS by either killing the infectious organism, impeding the infection mechanism or interrupting the replication cycle of the organism. Squalamine (an aminosterol host defence molecule of the dog fish shark Squalus canthias) and PGLa (a frog antimicrobial peptide) analogues may also be useful in inhibiting STD infection and transmission
inestine is an important endocrine organ and many physiologically active peptides have been isolated from it. This peptide inhibits the growth of, and may kill, bacteria, pref. gram negative bacteria. This peptide or its functional derivatives may be used in human or veterinary medicine for therapeutic or prophylactic use. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ζq

The present peptide is a synducin, which induces the expression of syndecan-1 and syndecan-4 on the surface of mesenchymal cells, esp. fibroblasts and epithelial cells. The 36 N-terminal amino acids of the opeptide were found to be identical to the 36 N-terminal amino acids of PR-98 peptide were found to be identical to the 36 N-terminal amino acids of Resistances in the proposed previously found in porcine intestine (W09222578). Synducins may be used in the treatment of stasis and decubitus ulcers, keloids, skin burns, ischemic tissues and hypercoagulation states, prevention of tumour metastasis, restenosis inhibition and endothelial cells were assayed for syndecan-4 expression following exposure to 5 % wound fluid, dbcAMP (1 mM), the present peptide (10 microM) or a blank, to give respective cell surface syndecan-4 values (mOD/m in) of approx. 1.75, 1.70, 1.80 and 0.95
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modulating mesenchymal interaction by administration of synducin - used in the treatment of wounds, tumours, restenosis, etc.

This sequence represents the proline-arginine rich antimicrobial peptide PR39. The PR39 sequence was first isolated from porcine small intestine, and has also been identified in human and porcine neutrophils. PR39 kills bacteria by interfering with DNA and/or protein synthesis. PR39 also induces syndecan expression on mesenthymal cells. Syndecans are important in wound repair, showing that PR39 can be used in wound repair, as well of a in antibacterial agents. This sequence, and the fragments of it shown in AAW01447-W01454, can be used in the method of the invention. The method of the invention is for inhibiting leukocyte superoxide anion (02-02) production. The method contine the method of the invention is for inhibiting leukocyte of peptide (such as this sequence) capable of inhibiting leukocyte of peptide. The peptides can be used as medicaments for fighting infection by attracting leukocytes, to a wound site and restricting tissue damage at the wound site caused by excessive oxygen radicals produced by these leukocytes. They can also be used to develop products for treating inflammatory disease states
                                                                             Inhibitor; leukocyte O2- production; proline-arginine rich peptide; pig; antimicrobial peptide; small intestine; human; neutrophil; bacteria; DNA syntheals; protein synthesis; inhibitor; syndecan expression; mesenchymal cell; wound repair; superoxide anion; infection; leukocyte; tissue damage; oxygen radical; inflammatory disease; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Inhibition of leukocyte super:oxide anion prodn. and attraction of leukocytes - using peptide(s) partic. based on antimicrobial PR-39.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                     the small intestine.";
J. Leukoc. Biol. 56:807-811(1994).
-!-FUNCTION: Exerts a potent antimicrobial activity against both E.coli and B.megaterium.
-!- TISSUE SPECIFICITY: Small intestine and bone marrow.
-!- SIMILARITY: Belongs to the cathelicidin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

arrholt ubsquitin-protein isopeptide ligase activity.";
J. Biol. Chem. 278:1230-21937(2003).
C.I. FUNCTION: Regulator of Notch signaling pathway
involved in cell-cell communications that regulates a broad
spectrum of cell-fate determinations. Probably acts both as a
positive and negative regulator of Notch, depending on the
developmental and cell context (By similarity). Functions as an
developmental and cell context (By similarity). Functions as an
ubiquitin ligase protein in vitro, suggesting that it may regulate
the Notch pathway via some ubiquitin ligase activity.
C. I- SUBUNIT: Homomultimer. May form a heteromultimer with other
members of the Deltex family. Interacts with NOTCH1 (By This SWISS-PROT entry is copyright. Probably acts both as a positive and negative regulator of Notch, depending on the developmental and cell context. Functions as an ubiquitin ligase protein in vitro, suggesting that it may regulate the Notch pathway via some ubiquitin ligase activity (By similarity).

-!- SUBUNIT: Homomultimer. May form a heteromultimer with other members of the Deltex family. Interacts with NOTCH1.

-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).

-!- TISSUE SPECIFICITY: Strongly expressed in testis and brain. Weakly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             expressed in kidney.

DEVELOPMENTAL STAGE: In the CNS, it is expressed in the developing neural tube starting from E10.5 in the spinal cord and around E11.5 in the telencephalon. Expressed ubiquitously throughout the spinal cord and telencephalon during neurogenesis. Expressed throughout the developing retina at E15.5. Not expressed in the somite or presomite during somitogenesis. Expressed in the

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
